You are given a dataset in JSON format text_segmentation_dataset.json. The dataset is a snapshot from the large Brown corpus. You need to implement two text segmentation techniques to segment the text into words and report their performance.

1. Greedy Based Approach that matches the longest word
2. Dynamic Programming Approach that increases the log probability of the text [Hint: Frequencies of Words are given]

You need to report two evaluation metrics.

1. Accuracy
2. Edit Distance
